To help alleviate sound reverberation problems, we installed Spray-on-Acoustical system K-13 to the ceiling of the Pole Building. This product has the ability to conform to any substrate configuration and can be applied at a variety of thicknesses, meaning quick installation and superior acoustical control. The resilient fibers of K-13 absorb sound energy instead of reflecting it, reducing reverberation and excessive noise greatly improving ambient sound quality and intelligibility. K-13 is available in seven standard colors (Black, Gray, Light Gray, White, Beige, Tan, and Cocoa) and can also be specified in specially matched custom colors. This makes K-13 an ideal surface finish for all projects.

"From an incoherent rumble, this space has been transformed to an enjoyable experience without the company of endless reverberation and echo"
~ Dan Wafle
(Wafle-Thomas-Lubinski Builders LLC)
